Data Fluency

Final Group Assignment

IE Business School

During our last 2 sessions together, each group will be presenting their final project which puts into practice learnings throughout our entire Data Fluency course - particularly emphasizing skills around data visualization and data storytelling. Groups will be allotted **8-10 minutes** for their presentation.

Instructions

Use your groups assigned dataset from this folder OR choose your own (for more inspiration, check out this list of public data sources). You can include additional datasets, too. Analyze the data and create a 'problem' you would like to solve with that data. For example, do you want to analyze an employee database to understand characteristics of the teams and possible factors that could be contributing to attrition? Do you want to investigate different buying habits compared across countries and ages to advise a team of investors?

Expectations

Present an end-to-end keynote presentation of the analysis you have performed for the problem-solution regarding your dataset. You must build a dashboard in Data Studio and you should present your findings live to the class. You are welcome to present your findings live via your dashboard if it is a part of your story, but the majority of the presentation time should be spent walking us through a data story via slides (PowerPoint, Google Slides, Canva, etc).

Evaluation

The dashboard and the live presentation each count for 50% of the project grade. The key criteria for passing the assignment will be your ability to put everything together...

- Effectively-built dashboard. Adherence to design principles and proper taxonomy, clear understanding of class topics is demonstrated.
- Solid overall storyline, context / situation and problem explained, and how you framed it into a data-informed solution, frameworks or methodologies used, next steps proposed.

- Purpose-driven data visualizations to support, persuade, illustrate, communicate to or influence your audience (fitting visualizations used for the target audience, also clearly explain who your target audience is).
- Key messages and clear insights communicated, conclusions or recommendations included.
- Strong identification of key relevant question(s) ('problem') that you want to answer with your data, and the respective attempt to answer those questions ('solution').
- Avoidance of 'silly errors' and typos, visually appealing presentation with flow that supports the story, sources and resources used are clearly noted.
- Authenticity, ownership and appropriate use of AI are critical! AI may be used and is even encouraged to support the creation of data visualizations and the development of your data story, but the final presentation must demonstrate your own understanding, judgement and unique voice, the narrative should feel purposeful and natural rather than copied or overly AI-processed.

There is a preference for you to explore and go beyond the use of only conventional plots (e.g. bar graphs, line charts and pie charts) but only *where appropriate*. This is not required to pass the assignment. Also, if you would like to build a 'nonconventional' plot but you do not know how to build it or it is not available within the Data Studio platform, you are allowed to create it with another tool like Excel, Python, Tableau, Canva, etc. and use it within presentation slides. Don't let Data Studio limit your data story. You can think of them as two separate products. Your data story may include different visualizations if you prefer, or modified versions of the graphs created in Data Studio.

Submission

Ensure that one member of the group uploads the following material to Blackboard here in the designated Assignment block:

- Link to the Data Studio dashboard (*make sure you have made it publicly viewable*, 5 points will be deducted from the final grade if I must request access permissions) and a PDF download of the dashboard
- Presentation file PPT, Canva or similar
- Any other relevant materials

DUE by midday, the day of Session 9-10.
Late submissions will not be accepted.
